

Ski Resort Data Analytics

Project Overview

- This project focuses on analyzing global ski resort data to understand resort distribution, pricing patterns, infrastructure, and market performance across different countries.
- The analysis helps identify regional market trends, infrastructure strength, and pricing differences among ski resorts.
- Interactive dashboards were created using Looker Studio to provide meaningful business insights.
- The project supports tourism analysis by evaluating resort characteristics and market segmentation.
- Overall, the project helps understand the global ski tourism industry through data-driven visualization and analysis.

Objectives

- To analyze the global distribution of ski resorts across different countries.
- To compare pricing patterns among ski resorts in different regions.
- To evaluate ski resort infrastructure based on slopes and lifts.
- To identify the characteristics of premium and mid-tier ski resorts.
- To analyze regional market dominance in the ski tourism industry.
- To compare the overall performance of ski resorts across countries.
- To generate business insights using interactive Looker Studio dashboards.

Dataset Information

- The dataset contains information about ski resorts, including resort names, countries, prices, slopes, lifts and geographical locations.
- The analysis includes 499 ski resorts, 42,867 slopes, and 12,107 lifts across multiple countries.
- Approximately 70% of the ski resorts are located in Europe, making the dataset suitable for analyzing global ski tourism trends.

Data Cleaning

- Removed duplicate records.
- Handled missing values.
- Standardized country and resort names.
- Corrected data types.
- Verified data consistency.
- Prepared the cleaned dataset using Google Sheets before importing it into Looker Studio.

Data Transformation

- Created calculated fields for analysis.
- Aggregated resort data for country-wise comparison.
- Categorized resorts based on pricing and infrastructure.
- Applied filters to improve interactive dashboard analysis.

Exploratory Data Analysis and Visualization

- Created KPI cards to display total resorts, slopes, lifts and market share.
- Analyzed country-wise ski resort distribution.
- Compared resort pricing across different countries.
- Evaluated infrastructure using slopes and lift capacity.
- Identified premium and mid-tier resort categories.
- Built interactive visualizations using maps, bar charts, pie charts and comparison charts.

Key Findings

- The analysis includes 499 ski resorts, 42,867 slopes, and 12,107 lifts across multiple countries.
- Europe accounts for approximately 70% of the global ski resort market, making it the leading region for ski tourism.
- The United States, Switzerland, and Austria have the highest-priced ski resorts compared to other countries.

- Most ski resorts have an infrastructure capacity of approximately 600 slopes, indicating a consistent level of development.
- Resort pricing is influenced more by geographical location and tourism demand than by infrastructure size.
- Asia and South America have fewer ski resorts and represent emerging tourism markets.

Business Insights

- Europe remains the leading region in the global ski tourism industry.
- Premium pricing is mainly observed in the United States, Switzerland and Austria.
- Similar infrastructure across most resorts reflects consistent investment in ski tourism facilities.
- Emerging regions provide opportunities for future tourism development.
- Interactive dashboards help support tourism planning, market analysis and business decision-making.

Conclusion

- The analysis successfully evaluated ski resort distribution, pricing, infrastructure, and market performance across different countries.
- Europe dominates the global ski tourism industry with approximately 70% of the total market.
- Premium resorts are concentrated in the United States, Switzerland, and Austria, while emerging markets continue to grow.
- The dashboard provides valuable insights into pricing strategies, infrastructure development and regional tourism trends.
- Overall, the project demonstrates how Looker Studio can transform tourism data into meaningful insights for tourism planning and business decision-making.
